Abstract. The Kirchhoff index of a connected graph is the sum of resistance distances between all unordered pairs of vertices in the graph. Its considerable applications are found in a variety of fields. In this paper, we determine the maximum value of Kirchhoff index among the unicyclic graphs with fixed number of vertices and maximum degree, and characterize the corresponding extremal graph.

Keywords. Kirchhoff index, Maximum degree, Unicyclic graphs

1 Introduction

First we introduce some graph notations used in this paper. We only consider finite, undirected and simple graphs. Other undefined terminologies and notations may refer to [1]. Let G be a connected graph with vertex set $V(G)$, whose vertices are labeled as v_1, v_2, \dots, v_n . The famous Wiener index is considered as one of the most applicable graph invariant, used as one of the topological indices for predicting physicochemical properties of organic compounds. The distance between vertices v_i and v_j , denoted by $d(v_i, v_j)$, is the length of a shortest path between them. The Wiener index $W(G)$ [25] is the sum of distances between all pairs of vertices, that is,

$$W(G) = \sum_{i < j} d(v_i, v_j).$$

In 1993, Klein and Randic [14] introduced a new distance function named resistance distance basing on electrical network theory. They view graph G as an electrical network such that each edge of G is assumed to be a unit resistor. The resistance distance between vertices v_i and v_j , denoted by $r(v_i, v_j)$ (if more than one graphs are considered, we use $r_G(v_i, v_j)$ to avoid confusion), is defined to be the effective resistance between nodes v_i and v_j in G . Analogue to Wiener index, the Kirchhoff index $Kf(G)$ is defined as:

$$Kf(G) = \sum_{i < j} r(v_i, v_j).$$

Let $Kf_{v_i}(G)$ denote the sum of all distances between vertex v_i and the other vertices of G , that is

$$Kf_{v_i}(G) = \sum_{j \neq i} r(v_i, v_j).$$

Kirchhoff index attracted extensive attention due to its wide applications in physics, chemistry, graph theory, etc. [2–5, 8–12, 16–18, 20, 22, 24, 26, 27, 29, 30]. And some related results have been given in [6, 7, 13, 15, 19, 21].

A graph G is called a unicyclic graph if it contains exactly one cycle. We may use the following notation [28] to represent a unicyclic graph:

$$G = U(C_l; T_1, T_2, \dots, T_l),$$

where C_l is the unique cycle in G with $V(C_l) = v_1, v_2, \dots, v_l$ such that v_i is adjacent to v_{i+1} (subscript module l) for $1 \leq i \leq l$. For each i , let T_i be the component of $G - (V(C_l) - v_i)$ containing v_i . Obviously T_i is a tree. We say T_i trivial if it is an isolated vertex. For example, see Fig. 1.

Fig. 1. $U(C_l; T_1, T_2, \dots, T_l)$.

For convenience, we employ the following notation. Let $T_{n,\Delta}$ [23] be the tree on n vertices obtained from a path $P_{n-\Delta+1}$ and an empty graph $\overline{K}_{\Delta-1}$ by joining one end-vertex of $P_{n-\Delta+1}$ with every vertex of $\overline{K}_{\Delta-1}$. Let S_n^l [28] denote the graph obtained from cycle C_l by adding $n-l$ pendent edges to a vertex of C_l . Let P_n^l [28] denote the graph obtained by identifying one end vertex of P_{n-l+1} with any vertex of C_l . And $\mathcal{P}_{n,\Delta}^l$ denote the set of the graphs obtained from P_t^l ($t \leq n-1$) by attaching $n-t$ pendent edges to one vertex such that its degree achieves maximum degree Δ among all vertices. It is obvious that $S_n^n = P_n^n = C_n$.

In order to better understand these graphs, we consider the set $\mathcal{G}_{n,l,\Delta}$, $\Delta \geq 2$, of connected graphs with n vertices containing cycle C_l having the fixed value of the maximum degree Δ . Otherwise, if we only bound the maximum degree by Δ , the graphs of maximum Kirchhoff index

will inevitably be the paths. Still, even with the requirement that a graph contains a vertex of degree Δ , the extremal graphs resemble a pathlike structure.

In this paper, we determine the maximum value of Kirchhoff index among the unicyclic graphs with fixed number of vertices and maximum degree, and characterize the extremal graphs. At the end of the article, we also give the conjecture on minimum Kirchhoff index among the unicyclic graphs with fixed number of vertices and maximum degree, and the extremal graphs.

2 Main Result

Theorem 2.1. *For every graph $G \in \mathcal{G}_{n,l,\Delta}$, where $l \geq 3$ and $n \geq l + \Delta - 2$,*

$$Kf(G) \leq \frac{(n - \Delta + 1)(n - \Delta + 2)(n + 2\Delta - 9)}{6} + (\Delta - 3)(\Delta - \frac{2}{3}) + (n - \Delta)^2 + \frac{7(n - \Delta)}{3} + 2,$$

with equality holding if and only if $G \cong P_{n,\Delta}^3$ (see Fig. 2).

Fig. 2. $P_{n,\Delta}^3$.

3 The Proofs

As we work with connected graphs only, the case $\Delta = 1$ becomes possible only when $n = 2$. Similarly, for $\Delta = 2$ the only elements of $\mathcal{G}_{n,\Delta}$ are the path P_n and the cycle C_n . Thus, we may assume that $\Delta \geq 3$ holds in the sequel. We start our proofs with a very simple lemma.

Lemma 3.1. [14] *Let x be a cutvertex of a graph, and let a and b be vertices occurring in different components which arise upon deletion of x . Then*

$$r(a, b) = r(a, x) + r(x, b).$$

Lemma 3.2. [28] *Let $G = U(C_l; T_1, T_2, \dots, T_l)$. Then*

$$Kf(G) = \sum_{i=1}^l W(T_i) + \sum_{i < j} (|V(T_j)|W_{v_i}(T_i) + |V(T_i)||V(T_j)|\frac{(j-i)(l-j+i)}{l} + |V(T_i)|W_{v_j}(T_j)).$$

Lemma 3.3. Assume that the vertex of maximum degree belongs to $V(T_l)$. Let $G = U(C_l; T_1, T_2, \dots, T_l)$ and $G' = U(C_l; P_1, P_2, \dots, P_{l-1}, T_l)$. Then

$$Kf(G) < Kf(G').$$

Proof. Since $W(T_n) < W(P_n)$, by the Lemma 3.2,

$$\begin{aligned} Kf(G) &= \sum_{i=1}^l W(T_i) + \sum_{i < j \leq l} (|V(T_j)|W_{v_i}(T_i) + |V(T_i)||V(T_j)|\frac{(j-i)(l-j+i)}{l} + |V(T_i)|W_{v_j}(T_j)) \\ &< \sum_{i=1}^l W(T_i) + \sum_{i < j < l} (|V(P_j)|W_{v_i}(P_i) + |V(P_i)||V(P_j)|\frac{(j-i)(l-j+i)}{l} + |V(P_i)|W_{v_j}(P_j)) \\ &\quad + |V(T_l)|W_{v_i}(P_i) + |V(P_i)||V(T_l)|\frac{(l-i)(0+i)}{l} + |V(P_i)|W_{v_l}(T_l) \\ &= Kf(G'). \quad \square \end{aligned}$$

Lemma 3.4. Let $G \in \mathcal{G}_{n,l,\Delta}$, $G \notin \mathcal{P}_{n,\Delta}^l$ and assume that the vertex of maximum degree belongs to $V(T_l)$. Then $Kf(G) < Kf(H)$ for every $H \in \mathcal{P}_{n,\Delta}^l$.

Proof. Suppose that $G_0 = U(C_l; T_1, T_2, \dots, T_l)$ has maximal Kirchhoff index among $\mathcal{G}_{n,l,\Delta}$.

Claim 1. For each i , T_i is a path with v_i as one of its end vertices.

For each i , $W(T_i)$ is maximal if and only if T_i is a path and it is easy to observe that $W_{v_i}(T_i)$ is maximal if and only if T_i is a path with v_i as one of its end-vertices. Hence Claim 1 holds by Lemma 3.2.

Claim 2. If $l < n$, all but one of the T_i are trivial.

Suppose to the contrary that there exists at least two trees such that they all have more than one vertices. Let T_i and T_j be two such trees. By Claim 1, T_i and T_j are both paths. Let $a \neq v_i$ and $b \neq v_j$ be endvertices of T_i and T_j , respectively. Without losing generality, assume that $Kf_a(G_0) \geq Kf_b(G_0)$. Let c be the neighbor of b and $G'_0 = G_0 - cb + ab$. Now we show that $Kf(G'_0) > Kf(G_0)$.

For any two vertices x, y different from b , $r_{G_0}(x, y) = r_{G'_0}(x, y)$, hence

$$Kf(G_0) - Kf_b(G_0) = Kf(G'_0) - Kf_b(G'_0).$$

On the other hand,

$$Kf_b(G'_0) = Kf_a(G'_0) + n - 2 = Kf_a(G_0) + 1 - r_{G_0}(a, b) + n - 2.$$

Since $r_{G_0}(a, b) < d_{G_0}(a, b) < n - 1$, it follows that $Kf_b(G'_0) > Kf_a(G_0) \geq Kf_b(G_0)$. Hence

$$Kf(G'_0) = Kf(G_0) - Kf_b(G_0) + Kf_b(G'_0) > Kf(G_0).$$

This contradicts the choice of G_0 , which implies Claim 2.

Claims 1 and 2 yield Lemma 3.4. \square

Lemma 3.5. [23] For every graph $G \in \mathcal{G}_{n,\Delta}$, it holds that

$$W(G) \leq W(T_{n,\Delta})$$

with equality if and only if G is isomorphic to $T_{n,\Delta}$.

By the Lemma 3.3 and the Lemma 3.5, the number of the maximum degree less value is greater, i.e. when only one of the maximum degree value maximum. Therefore, to calculate the maximum, only need to discuss only one of the maximum degree situation can be.

Lemma 3.6. Let $l \geq 3$, then $\max_{G \in \mathcal{P}_{n,\Delta}^l} \{Kf(G)\}$ achieves when the maximum degree vertex is the connection point of the tree and the cycle.

Proof. By Lemma 3.5, $Kf(G)$ ($G \in \mathcal{P}_{n,\Delta}^l$) achieves maximum only if G is one of two special graphs in $\mathcal{P}_{n,\Delta}^l$ (see Fig. 3). Let the kirchhoff index of (a) and (b) in Fig. 3 be $Kf_{(a)}$ and $Kf_{(b)}$, respectively.

Fig. 3. two special graphs in $\mathcal{P}_{n,\Delta}^l$.

By a routine calculation,

$$Kf(C_l) = \frac{l^3 - l}{12},$$

$$W(T_{n,\Delta}) = \binom{n-\Delta+2}{3} + (\Delta-1) \frac{(n-\Delta+1)(n-\Delta+2)}{2} + (\Delta-1)(\Delta-2)$$

and

$$Kf_{v_i}(C_l) = \frac{1 \cdot (l-1)}{l} + \frac{2 \cdot (l-2)}{l} + \dots + \frac{(l-1) \cdot 1}{l} = \frac{l^2 - 1}{6}.$$

Then

$$\begin{aligned}
Kf_{(a)} &= Kf(C_l) + Kf(T_{n-l+1, \Delta-2}) + (\Delta-2)Kf_{v_l}(C_l) + (\Delta-2)(l-1) \cdot 1 \\
&\quad + (n-l-\Delta+2)Kf_{v_l}(C_l) + (l-1) \sum_{i=2}^{n-l-\Delta+3} i \\
&= \frac{l^3-l}{12} + \binom{n-l-\Delta+5}{3} + (\Delta-3) \frac{(n-l-\Delta+4)(n-l-\Delta+5)}{2} + (\Delta-3)(\Delta-4) \\
&\quad + (\Delta-2) \frac{l^2-1}{6} + (\Delta-2)(l-1) + (n-l-\Delta+2) \frac{l^2-1}{6} \\
&\quad + (l-1) \frac{(n-l-\Delta+2)(n-l-\Delta+5)}{2} \\
&= \frac{l^3-l}{12} + \frac{(n-l-\Delta+5)(n-l-\Delta+4)(n-l+2\Delta-6)}{6} + \frac{(n-l)(l^2-1)}{6} \\
&\quad + (\Delta-2)(l-1) + (\Delta-3)(\Delta-4) + \frac{(l-1)(n-l-\Delta+2)(n-l-\Delta+5)}{2}
\end{aligned}$$

and

$$\begin{aligned}
Kf_{(b)} &= Kf(C_l) + Kf(T_{n-l+1, \Delta}) + Kf_{v_l}(C_l)(n-l-\Delta+1) + (l-1) \sum_{i=1}^{n-l-\Delta+1} i \\
&\quad + (\Delta-1)Kf_{v_l}(C_l) + (n-l-\Delta+2)(\Delta-1)(l-1) \\
&= \frac{l^3-l}{12} + \binom{n-\Delta-l+3}{3} + (\Delta-1) \frac{(n-l-\Delta+2)(n-l-\Delta+3)}{2} + (\Delta-1)(\Delta-2) + \\
&\quad (n-l) \frac{l^2-1}{6} + (l-1) \frac{(n-l-\Delta+1)(n-l-\Delta+2)}{2} + (n-l-\Delta+2)(\Delta-1)(l-1) \\
&= \frac{l^3-l}{12} + \frac{(n-l-\Delta+2)(n-l-\Delta+3)(n-l+2\Delta-2)}{6} + \frac{(n-1)(l^2-1)}{6} + (\Delta-1) \\
&\quad (\Delta-2) + (n-l-\Delta+2)(\Delta-1)(l-1) + \frac{(l-1)(n-l-\Delta+1)(n-l-\Delta+2)}{2}.
\end{aligned}$$

Consequently,

$$\begin{aligned}
Kf_{(a)} - Kf_{(b)} &= Kf(T_{n-l+1, \Delta-2}) + (\Delta-2)(l-1) + (l-1) \frac{(n-l-\Delta+2)(n-l-\Delta+5)}{2} \\
&\quad - \left[Kf(T_{n-l+1, \Delta}) + (n-l-\Delta+2)(\Delta-1)(l-1) \right. \\
&\quad \left. + (l-1) \frac{(n-l-\Delta+1)(n-l-\Delta+2)}{2} \right] \\
&= -5n + 12\Delta + 2n\Delta - 2\Delta^2 - 18 - 2\Delta l + 5l - 4\Delta + 10 + (l-1)(-n\Delta + l\Delta \\
&\quad + \Delta^2 + 3n - 3l - 4\Delta + 4) \\
&= (\Delta-3)l^2 + (\Delta^2 - 7\Delta - n\Delta + 3n + 12)l - 8n + 12\Delta + 3n\Delta - 3\Delta^2 - 12 \\
&= (\Delta-3)l^2 + (\Delta-3)(\Delta-n-4)l - 8n + 12\Delta + 3n\Delta - 3\Delta^2 - 12.
\end{aligned}$$

When $\Delta = 3$, we have $Kf_{(a)} - Kf_{(b)} = n - 3 > 0$.

And when $\Delta > 3$, we have

$$\begin{aligned}
Kf_{(a)} - Kf_{(b)} &= (\Delta - 3)l^2 + (\Delta - 3)(\Delta - n - 4)l + 3(\Delta - 3)(n - \Delta + 1) + (n - 3) \\
&= l(\Delta - 3)(l + \Delta - n - 4) + 3(\Delta - 3)(n - \Delta + 1) + (n - 3) \\
&> 3(\Delta - 3)(l + \Delta - n - 4) + 3(\Delta - 3)(n - \Delta + 1) + (n - 3) \\
&= 3(\Delta - 3)(l - 3) + (n - 3) \\
&> 0.
\end{aligned}$$

Hence Lemma 3.6 follows. \square

Lemma 3.7. *Let $G \in \mathcal{P}_{n,\Delta}^l$, $3 \leq l \leq n$, then $Kf(G) \leq Kf(P_{n,\Delta}^3)$ and with equality holding if and only if $G \cong P_{n,\Delta}^3$.*

Proof. While the maximum degree vertex is the connection point of the tree and the cycle,

$$\begin{aligned}
Kf(P_{n,\Delta}^3) &= Kf(C_3) + Kf(T_{n-2,\Delta-2}) + \sum_{v_i \in C_3 \setminus \{v_3\}, v_j \in T_{n-2,\Delta-2} \setminus \{v_3\}} r_{v_i v_j} \\
&= 2 + \binom{n-\Delta+2}{3} + (\Delta - 3) \frac{(n - \Delta + 1)(n - \Delta + 2)}{2} + (\Delta - 3)(\Delta - 4) + \frac{10}{3}(\Delta - 3) \\
&\quad + 2 \left[\frac{2}{3}(n - \Delta) + \frac{(n - \Delta)(n - \Delta + 1)}{2} \right] \\
&= \frac{(n - \Delta + 1)(n - \Delta + 2)(n + 2\Delta - 9)}{6} + (\Delta - 3)(\Delta - \frac{2}{3}) + (n - \Delta)^2 + \frac{7}{3}(n - \Delta) \\
&\quad + 2.
\end{aligned}$$

Hence we have

$$\begin{aligned}
Kf(P_{n,\Delta}^3) - Kf_{(a)} &= \frac{l^3}{12} - \frac{nl^2}{6} - (\Delta + \frac{1}{12} - 2)l + n^2 + \frac{5}{2}n - 2n\Delta + \Delta^2 + 2\Delta - 10 - \frac{l^3}{3} + \\
&\quad (\frac{n}{2} - \Delta + \frac{7}{2})l^2 + (n\Delta - \frac{7}{2}n - \Delta^2 + 8\Delta - \frac{85}{6})l - n^2 - n\Delta + 5n + 2\Delta^2 \\
&\quad - 14n + 22 \\
&= -\frac{l^3}{4} + (\frac{7}{2} - \Delta)l^2 + (-\Delta^2 + 7\Delta - \frac{49}{4})l + 3\Delta^2 - 12\Delta + 12 + (\frac{l^2}{3} + l\Delta - \\
&\quad \frac{7}{2}l - 3\Delta + \frac{15}{2})n.
\end{aligned}$$

And

$$\frac{l^2}{3} + l\Delta - \frac{7}{2}l - 3\Delta + \frac{15}{2} > 0, \quad n \geq l + \Delta - 2.$$

So

$$\begin{aligned}
Kf(P_{n,\Delta}^3) - Kf_{(a)} &\geq -\frac{l^3}{4} + (\frac{7}{2} - \Delta)l^2 + (-\Delta^2 + 7\Delta - \frac{49}{4})l + 3\Delta^2 - 12\Delta + 12 \\
&\quad + (\frac{l^2}{3} + l\Delta - \frac{7}{2}l - 3\Delta + \frac{15}{2})(l + \Delta - 2) \\
&= \frac{l^3}{12} + (\frac{1}{3}\Delta - \frac{2}{3})l^2 + (-\frac{3}{2}\Delta + \frac{9}{4})l + \frac{3}{2}\Delta - 3 \\
&\geq 0.
\end{aligned}$$

Now we arrive at our main result. \square

4 Example

When $n = 100$, $\Delta = 96$, the maximum kirchhoff index is as follows, see Fig. 4.

Fig. 4. $P_{100,96}^3$.

$$\begin{aligned}
 \max_{G \in \mathcal{G}_{100,3,96}} \{Kf(G)\} &= Kf(P_{100,96}^3) \\
 &= \frac{(100 - 96 + 1)(100 - 96 + 2)(100 + 2 \times 96 - 9)}{6} + (96 - 3)(96 - \frac{2}{3}) \\
 &\quad + (100 - 96)^2 + \frac{7}{3}(100 - 96) + 2 \\
 &= 1415 + 8866 + 16 + 9\frac{1}{3} + 2 \\
 &= 10308\frac{1}{3}.
 \end{aligned}$$

5 Conjecture

Above the maximum Kirchhoff index among the unicyclic graphs with fixed number of vertices and maximum degree is obtained. In the case of minimal values, we end the text to the following conjecture:

(i) When $n \leq 10$, or $n = 11(\Delta \geq 5)$, the Kirchhoff index among the unicyclic graphs with fixed number of vertices and maximum degree has a minimum value as shown below, see Fig. 5.

$$\begin{aligned}
 \min_{G \in \mathcal{G}_{n,l,\Delta}} \{Kf(G)\} &= \frac{(n - \Delta + 2)^3 - (n - \Delta + 2)}{12} + (\Delta - 2) \left[n - \Delta + 2 + \frac{(n - \Delta + 2)^2 - 1}{6} \right] \\
 &\quad + 2 \sum_{i=1}^{\Delta-3} i \\
 &= \frac{(n + \Delta - 2)(n - \Delta + 3)(n - \Delta + 1)}{12} + (\Delta - 2)(n - 1),
 \end{aligned}$$

where $l = n - \Delta + 2$.

Fig. 5. $G \in \mathcal{G}_{n,l,\Delta}$, with the minimum value of Kirchhoff index.

(ii) When $n \geq 12$, or $n = 11(\Delta \leq 4)$, the Kirchhoff index among the unicyclic graphs with fixed number of vertices and maximum degree has a minimum value as shown below, see Fig. 6.

Fig. 6. $G \in \mathcal{G}_{n,l,\Delta}$, with the minimum value of Kirchhoff index.

$$\begin{aligned}
\min_{G \in \mathcal{G}_{n,l,\Delta}} \{Kf(G)\} &= Kf(C_l) + x \cdot 2 \sum_{i=1}^{\Delta-3} i + x(\Delta-2) \left(\frac{l^2-1}{6} + l \right) \\
&\quad + (x-1)(\Delta-2)^2 \left[2 + \frac{(l-1) \cdot 1}{l} \right] + (x-2)(\Delta-2)^2 \left[2 + \frac{(l-2) \cdot 2}{l} \right] \\
&\quad + \dots \\
&\quad + 1 \cdot (\Delta-2)^2 \left[2 + \frac{(l-x+1) \cdot (x-1)}{l} \right] \\
&= \frac{l^3-l}{12} + x(\Delta-2)(\Delta-3) + x(\Delta-2) \left(\frac{l^2-1}{6} + l \right) + x(x-1)(\Delta-2)^2 \\
&\quad + (\Delta-2)^2 \sum_{i=1}^{x-1} \frac{i(l-i)(x-i)}{l},
\end{aligned}$$

where $l = n - x(\Delta - 2)$, and $x \leq l \leq x + \Delta - 2$, i.e. $\frac{n-\Delta+2}{\Delta-1} \leq x \leq \frac{n}{\Delta-1}$, x is a positive integer.
